

Türkiye

As part of our efforts to lower the barriers for Global IoT deployments, Tele2 IoT has unlocked access to the Turkish IoT market, providing our customers with regulatorily compliant means of connecting their permanently deployed devices in Türkiye.

What is it?

In the majority of countries, we can offer connectivity via traditional Roaming Agreements. However, due to local regulations prohibiting permanent roaming in some markets, traditional roaming is not enough to provide full scale global connectivity.

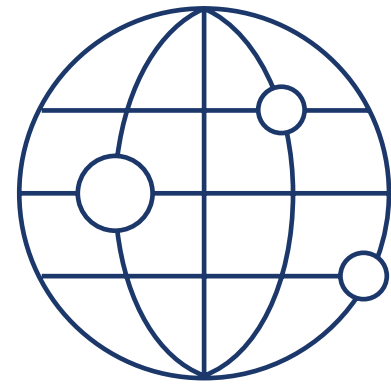

To enable our customers to deploy their IoT solutions in Türkiye, Tele2 IoT has partnered with the leading Turkish operator Turkcell. Thanks to this partnership as well as other efforts ensuring legal compliancy, Tele2 can offer permanent, regulatorily compliant connectivity in Türkiye to all our customers.

How it works

The service is based on a dedicated UICC SIM card and delivered through the Turkcell network to be fully compliant with the local regulation. The core services include SMS and Data, and add-on services such as private APN and VPN are available. Connectivity Control is done through a dedicated API.

Use cases requiring temporary roaming outside of Türkiye are also supported by the service, as roaming capabilities for the Turkish subscriber can be made available on request.
